ABSTRACT:
PURPOSE: To charge accurate rate for users by providing
rate classes by means
of the types of the users and inputting the rate classes at
the time of
inputting an appointment.

CONSTITUTION: An appointed date, the name of an appointed
conference room, the
name of a person who made the appointment and the rate
class for the person who
made the appointment are inputted from a terminal equipment
1. When the user
causes a magnetic card to pass through a magnetic card
reader before he uses
the conference room and when he pulls out the key 14 of the
appointed
conference room, key sensors 10a-10c are operated, the
pulling- out of the key
is detected in an input/output terminal 11, and it is taken
into a conference
room control part 5. The, it is referred to the
appointment and use start time

is stored. When the key is returned and inserted into a
key box 9 after a
conference terminates, the key sensors 10a-10c are operated
and use termination
time is stored in the conference room control part 5.
Then, the rate is
calculated based on the rate class inputted at the time of
the appointment in a
rate calculation part 21. Thus, the accurate conference
room use rate can
automatically be obtained and service as against the user
and the labor of the
person controlling the conference room can be saved.
